

Why REGS Safety

A plunge into the water with your car is the biggest nightmare for most drivers.

And in fact, these types of accidents make several thousands of casualties every year.

Research has shown, that the electrical systems of windows and doors malfunction within seconds after these systems come in contact with water.

Less known is that, even if the systems keep working, there is still no guarantee that windows and doors can actually be opened. Every expert nowadays agrees that, in case a car plunges into deep water, there is only one way out: through the side windows, and that as soon as possible.

Up to now, when windows cannot be opened, emergency hammers or other manual tools present the last hope.

Solving these problems, we hereby present the ultimate solution: the automated Rescue Escape Guidance System "REGS".

The REGS System

The patented REGS is an automated system which utilises sensors and software to detect that the vehicle has plunged into water.

Following this, REGS will, fully controlled, crash the side windows of the vehicle; enabling a safe and fast exit from the dangerous situation.

REGS has been developed in compliance with all applicable norms and regulations.

REGS can be installed quickly and conveniently into each type of car and will utilise circuits that are already present.

The system has been industrialised in close cooperation with leading high-tech companies from The Netherlands.

The REGS group is open for a license based cooperation with both the OEM and the aftermarket car service companies.
